U.S. DEPARTMENT OF COMMERCE

Frederick B. Dent, Secretary

SOCIAL AND ECONOMIC STATISTICS ADMINISTRATION

Edward D. Failor, Administrator

BUREAU OF ECONOMIC ANALYSIS

George Jaszi, Director

Morris R. Goldman, Deputy Director

Acknowledgments

This project required the efforts of many individuals. The tables were prepared under the direction of Beatrice N. Vaccara, Associate Director for National Analysis and Projections, and Eugene P. Roberts, Assistant Chief of the Interindustry Economics Division. The early phases were under the direction of Allan H. Young, presently Chief of the National Income and Wealth Division. Guidance was provided also by Martin L. Marimont, Associate Director for National Economic Accounts; Philip M. Ritz, Chief of the Interindustry Economics Division; Jack J. Gottsegen, Chief of the GNP by Industry Branch of the Division, and Albert J. Walderhaug, Chief of the Research and Analysis Branch of the Division. Important contributions in specific areas were made by the following persons in the Interindustry Economics Division.

Manufacturing and Mining: Leo C. Maley, Jr., Anthony P. Andrews, Stephen P. Baldwin, Marjorie S. Crenshaw, Douglas C. McIntosh, Marjorie K. Pavliscak, Mary J. Price.

Construction: Claiborne M. Ball.

Finance, Insurance, Real Estate: Janet B. Riddle, Elizabeth T. Spaulding.

Services and Communications: Carolyn B. Knapp, Elizabeth G. Rhodes.

Transportation: E. Lawrence Salkin, William A. Allen.

Trade: D. Anne Fisher, Robert T. Mangan.

Utilities and Final Demand: Nancy W. Simon.

Government: Irving Stern, Roy A. Seaton II, John R. Welty, Lucy J. Wayne.

Value Added: William Gullickson, Vesta C. Jones, Mark R. Meiners.

Special Studies: Paula C. Young, Howard L. Schreier, James E. Huyghebaert.

Systems Analysis and Computation: Norman E. Bakka, Joanne S. Thompson.

Secretarial: Brenda R. Stanley, E. Louise Adams, Karen D. Redman.

The data for the agricultural industries were prepared by Gerald Schluter and staff, U.S.D.A., Economic Research Service.

The study was financed in part by the U.S. Department of Transportation and the Defense Civil Preparedness Agency.

Preface

This volume is one of three that contain the basic tables for BEA's 1967 input-output study at the full industrial detail of 367 industries. The three volumes are:

Input-Output Structure of the U.S. Economy: 1967

Volume 1 - Transactions Data for Detailed Industries

Volume 2 - Direct Requirements for Detailed Industries

Volume 3 - Total Requirements for Detailed Industries

The 1967 input-output study is described more fully in the article, "Input-Output Structure of the U.S. Economy: 1967," appearing in the February 1974 Survey of Current Business. That article presents summary tables for 1967 in which the 367 detailed industries are aggregated to 85 industries; it explains the relationship of the input-output tables to the national income and product account; and it discusses various uses of input-output tables.

The transactions table (in Volume 1) shows for 1967 the dollar value of the transactions among the various industries, the sales of each industry to final markets and the value added originating in each industry. Each row of the table displays the distribution of the output of goods and services of the industry named at the beginning of the row to each of the industries and final users named across the top of the table. The columns show the value of each industry's current consumption (input) of raw materials, semi-finished products and services, and its value added in production.

The direct requirements table (in Volume 2) relates for 1967 each of the inputs of an industry to its total output. Each column in the table shows the inputs that the industry named at the head of the column required from each of the industries named at the beginning of the rows to produce a dollar of its output in 1967.

The total requirements table (in Volume 3) shows for 1967 the direct and indirect effects of final demand on the output of each industry. Each column in the table shows the amount of output required both directly and indirectly from each of the industries named at the beginning of the rows for a dollar of deliveries to final demand by the industry named at the head of the column.

In the tables, the individual industries and each of the final markets are identified by numerical code. Value added, which appears as a single entry for each industry, is identified by the letters V.A. Titles for the codes and the definitions of the industries in terms of the Standard Industrial Classification (where relevant) are provided in pages v to ix.

NOTE: The three volumes of Input-Output Structure of the U.S. Economy: 1967 may be purchased from the U.S. Government Printing Office, Washington, D.C. 20402 at the cost of \$3.25 for Volume 1 and \$3.15 each for Volumes 2 and 3. Checks should be made payable to the Superintendent of Documents. Reprints of the article with the 85-industry tables which appeared in the February 1974 Survey of Current Business may be purchased for \$1.00 from the same source.

Definitions and Conventions of the 1967 Input-Output Study 1/

Trade. The input-output tables do not trace actual flows to and from the trade industry. If trade were shown as buying and reselling, the detailed connections would be between the producing industries and trade, and the consuming industries and final users would make most of their purchases from a single source--trade. To show the links between producing industries and consuming industries or final markets, commodities are shown as if moving directly from producer to user, bypassing trade. Therefore, the output of trade is measured in terms of total margins, that is, operating expense plus profit.

Valuation of transactions. The valuation underlying the tables in this report is based on producers' prices.^{2/} Such prices exclude distribution costs, which constitute the difference between producers' and purchasers' prices. Under this valuation system, the individual inputs to an industry are valued at producers' prices, while the trade margin and transportation costs associated with the aggregate of these inputs appear as inputs to the consuming industry from the trade and transportation industries, respectively.

Classification of industries. For the enclosed tables, all productive activities of the U.S. economy are grouped into 367 industries. Most of these industries are defined in terms of the Standard Industrial Classification (SIC) Manual, 1967 edition. Three are "dummy" industries established to simplify the estimating procedures. As indicated above, a list of the industrial categories and their composition in terms of the SIC (where relevant) is given on pages v to ix.

Secondary products or activities. In most cases, secondary output is treated as if sold by the producing industry to the industry for which it is primary, and thus it is added to the output of the primary industry for distribution to users.^{3/} In some cases, where secondary output is considerably different from an industry's primary output, particularly when it is a large proportion of total output, the industry is redefined to exclude the secondary output. In these instances, the secondary output and associated inputs are subtracted from the producing industry (or industries) and added to the primary industry.

1. This subject is discussed much more fully in a document available upon request entitled "Definitions and Conventions of the 1967 Input-Output Study," Bureau of Economic Analysis, August 1974.

2. Producers' prices have been defined to include Federal and State and local excise taxes collected and paid by the producer.

3. The basic unit of classification in the SIC is the establishment. An establishment is classified in an industry on the basis of its principal activity. However, once an establishment is classified in an industry, its entire output, subsidiary as well as principal, is counted as part of the output of that industry. Its principal output, that which determines its industry classification, is called primary output; its other (subsidiary) output is called secondary.

Imports. Imports used for production (i.e., intermediate goods and services) which are substitutable for domestically produced goods and services ^{4/} are treated like secondary products; they are shown as if purchased by the industry producing the substitutable item and added to that industry's output.

Imports used in production which have no domestic counterparts, and imports purchased by final users in substantially the same form in which they were imported, are shown as purchased directly by the consuming industry or final market.

Gross output and gross input. Gross output of an industry represents the sum of the value of the following elements: (a) the total production by the industry, including both primary and secondary products or services; (b) the producers' value of the secondary products or services of other industries which are primary to the given industry; and (c) the domestic port value of substitutable imports, which are distributed as part of the output of the given industry.

Gross input of an industry is equal to the sum of the values of the following elements: (a) total consumption of goods and services required for the industry's total production; (b) value added by the industry; (c) the producers' value of the secondary products or services of other industries which are primary to the given industry; and (d) the domestic port value of substitutable imports.^{5/}

Gross output, the row total, equals gross input, the column total.

Inventories. The inventory change shown for each industry represents the change in inventories of the industry's primary products regardless of which industry actually owns or holds the inventories. (This is different from the customary approach to measurement of industry inventories in which the values represent total inventories held by each industry.) Inventories are so classified in the input-output table in order to make the row total equal to the output of each industry. Aside from the inventory item, the entries in a row add up to the total consumption (industrial and final use) of its products or services. The difference between this and the total output of the industry is the change in the inventories of its products wherever held. It is, therefore, this magnitude which must be entered as the inventory item.

4. Substitutability was determined on a judgmental basis using the following guide: the imports should be interchangeable with a domestically produced item without any changes in the technology of the consuming industry or the resultant product.

5. Thus, secondary products and substitutable imports are added to both the inputs and outputs.

Industry Classification of the 1967 Input-Output Tables

The titles in bold face represent the groupings of industries used for the summary version of the 1967 tables and were also used in the 1958 and 1963 input-output tables prepared by the Bureau of Economic Analysis.

Table 3. Total Requirements (Direct and Indirect) Per Dollar
of Delivery to Final Demand, 1967

(producers' prices)

Each entry represents the output required, directly and indirectly,
from the industry named at the beginning of the row for each dollar of
delivery to final demand by the industry named at the head of the column.

NOTES:

*Less than .000005.

To prevent requirements for scrap and by-products from generating
production, scrap and by-products have been treated as inputs to the producing
industry rather than to the consuming industry.
